

AADL : a radar case study

Back to radar case study

- ❑ Goal: to model a simple radar system
- ❑ Let us suppose we have the following requirements
 1. System implementation **is composed by physical devices** (Hardware entity): antenna + processor + memory + bus
 2. and **software entity : running processes and threads** + operating system functionalities (scheduling) implemented in the processor that represent a part of execution platform and physical devices in the same time.
 3. The **main process is responsible for signals processing** : general pattern: transmitter -> antenna -> receiver -> analyzer -> display
 4. **Analyzer is a periodic thread** that compares transmitted and received signals to perform detection, localization and identification.
 5. [..]

Tools used for modeling

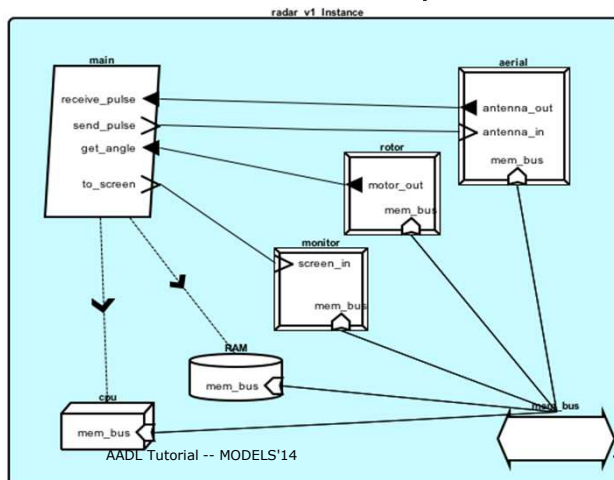

- AADL syntax is both textual and graphical, with several editors available
 - Modes exist for emacs, vi
 - OSATE2 provides a comprehensive IDE on top of Eclipse, and additional plug-ins
 - IMV : Instance Model Viewer
 - Consistency checkers, statistics, etc.
 - Adele: graphical editor for Eclipse

- In the following, we will use OSATE2 and IMV

Radar case study

- Hardware/Software breakdown: components

```
PACKAGE radar
PUBLIC
PROCESS processing
-- ...
END processing;
DEVICE antenna
-- ...
END antenna;
END RADAR;
```

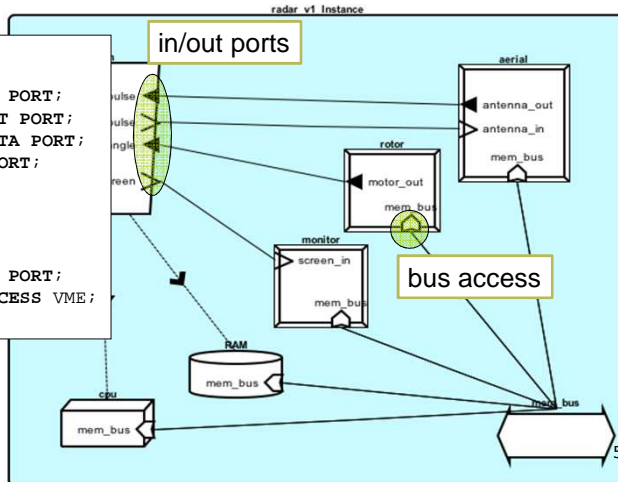

Radar case study

Hardware/Software breakdown: features

```

PROCESS processing
FEATURES
  to_screen : OUT EVENT PORT;
  send_pulse : OUT EVENT PORT;
  receive_pulse : IN DATA PORT;
  get_angle : IN DATA PORT;
END processing;

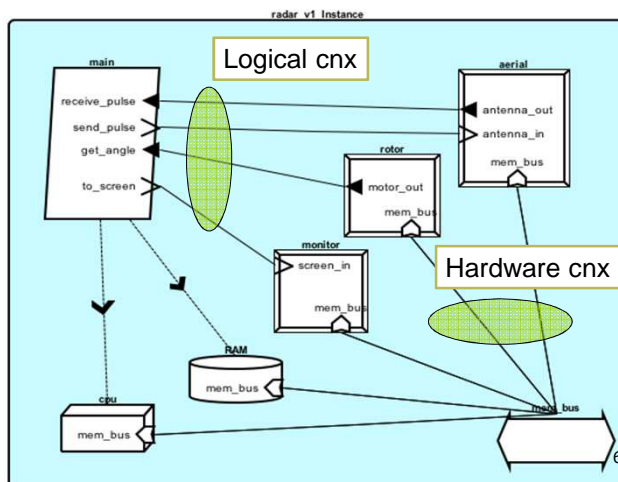

DEVICE antenna
FEATURES
  antenna_in : IN EVENT PORT;
  VME : REQUIRES BUS ACCESS VME;
END antenna;
    
```

Radar case study

Hardware/Software breakdown: connections

```
SYSTEM IMPLEMENTATION radar.simple
SUBCOMPONENTS
  aerial : DEVICE antenna;
  rotor  : DEVICE motor;
  monitor : DEVICE screen;
  main   : PROCESS processing.others;
  cpu    : PROCESSOR leon2;
  VME    : BUS VME;
  RAM    : MEMORY RAM;
CONNECTIONS
  PORT aerial.antenna_out -> main.receive_pulse;
  PORT rotor.motor_out    -> main.get_angle;
  PORT main.send_pulse    -> aerial.antenna_in;
  PORT main.to_screen     -> monitor.screen_in;
  BUS ACCESS VME -> aerial.VME;
  BUS ACCESS VME -> rotor.VME;
  BUS ACCESS VME -> monitor.VME;
  BUS ACCESS VME -> cpu.VME;
  BUS ACCESS VME -> RAM.VME;
```

9

A few words on AADL usage

- AADL is for architectural description, period
- Not to be compared with UML suites
 - Behavior, types, link with source code is not required
- Keep in mind models support an objective
 - For now, it is just a high-level view of the design
- In the next sections, we will complete the models with
 - Properties to support schedulability analysis
 - Elements to generate actual implementation
